

Under-Bar Bike Switch

Over the course of many hundreds of installations we have noticed that the standard switch assembly in certain applications is either difficult to fit, or in the case of riders with limited mobility in the hand, does not offer a very large target. We have therefore added this new design to our range.

The advantages are particularly apparent when you have heated grips - then you are unable to cut the grip and sometimes cannot move the switch cluster. Taking up only a very small space on the bar, this ergonomic design overcomes the problem, scalloped to fit neatly under the thumb. It is not suitable for all machines - on some sports bikes the bars are too close to the tank on full lock - in which case the original design is preferable.
